

CARSOLEL, a new tool developed for farmers to account for C sequestration in beef and dairy farms

**Hélène Chambaut
Institut de l'Elevage
France, Angers**

May 2021

Breeding cattle brings multi services to society

- Grassland based systems provide services

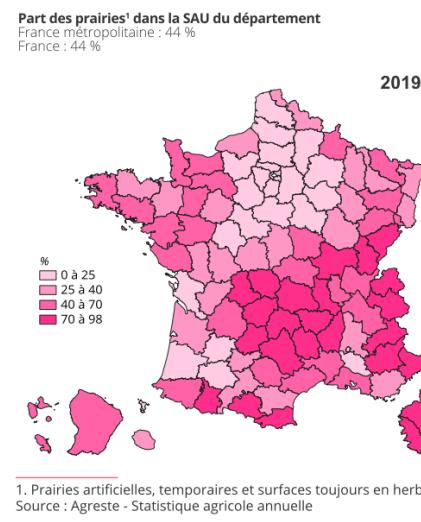

Maintain air, soil and water quality : e.g. few pesticides use, soil organic matter storage, soil biology

Avoid soil erosion in sloppy region

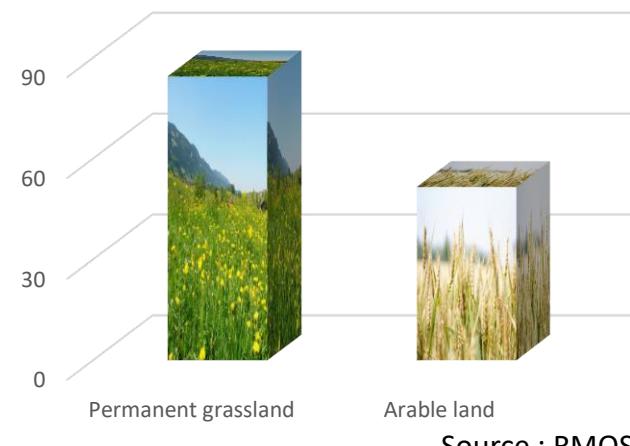

Enhance biodiversity : diverse flora and fauna, low N inputs, no pesticides

Protect water resources from nitrate leaching and P runoff

% Grassland area in Agriculture area , 2019

Average Carbon Stock in soil
(0-30 cm) TC/HA

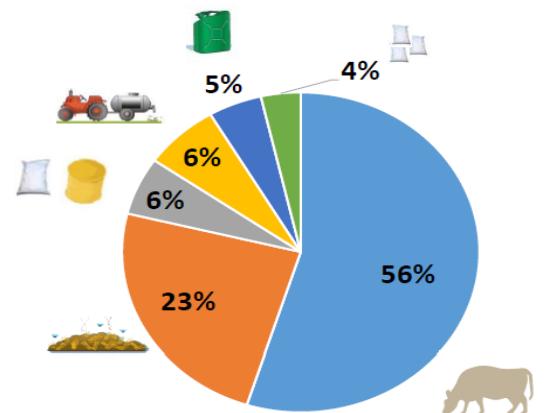

Climate mitigation options often focus on green house gases emissions (GHG)

- To decrease carbon emissions per unit product (milk or meat), action plans often encourage an intensification of herd management (e.g. higher daily gain, more milk per cow, shorten age at first calving...) to decrease methane.

More than 50% of GHG emission in French beef farms are CH4

Répartition des émissions

J. Andurand et al, 2021
Innovations Agronomiques 82

Accounting for C sequestration in soils is crucial for farm management strategies

- Intensification of herd management often leads to a conversion of grassland into fodder crops
- If grass-based cattle farms are replaced by crop-farming systems, land use management change may results in a loss of carbone in soil

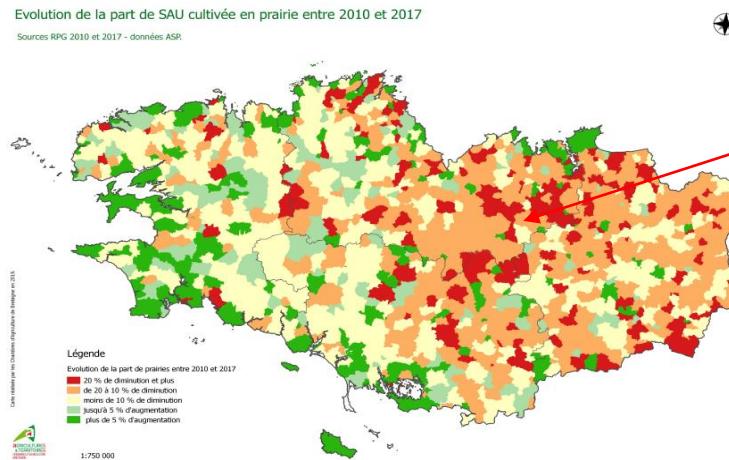

% Grassland in AA from 2010 to 2017

Réduction is

- More than 20%
- 10-20%
- Less than 10%

Increase is

- Less than 10%
- more than 10%

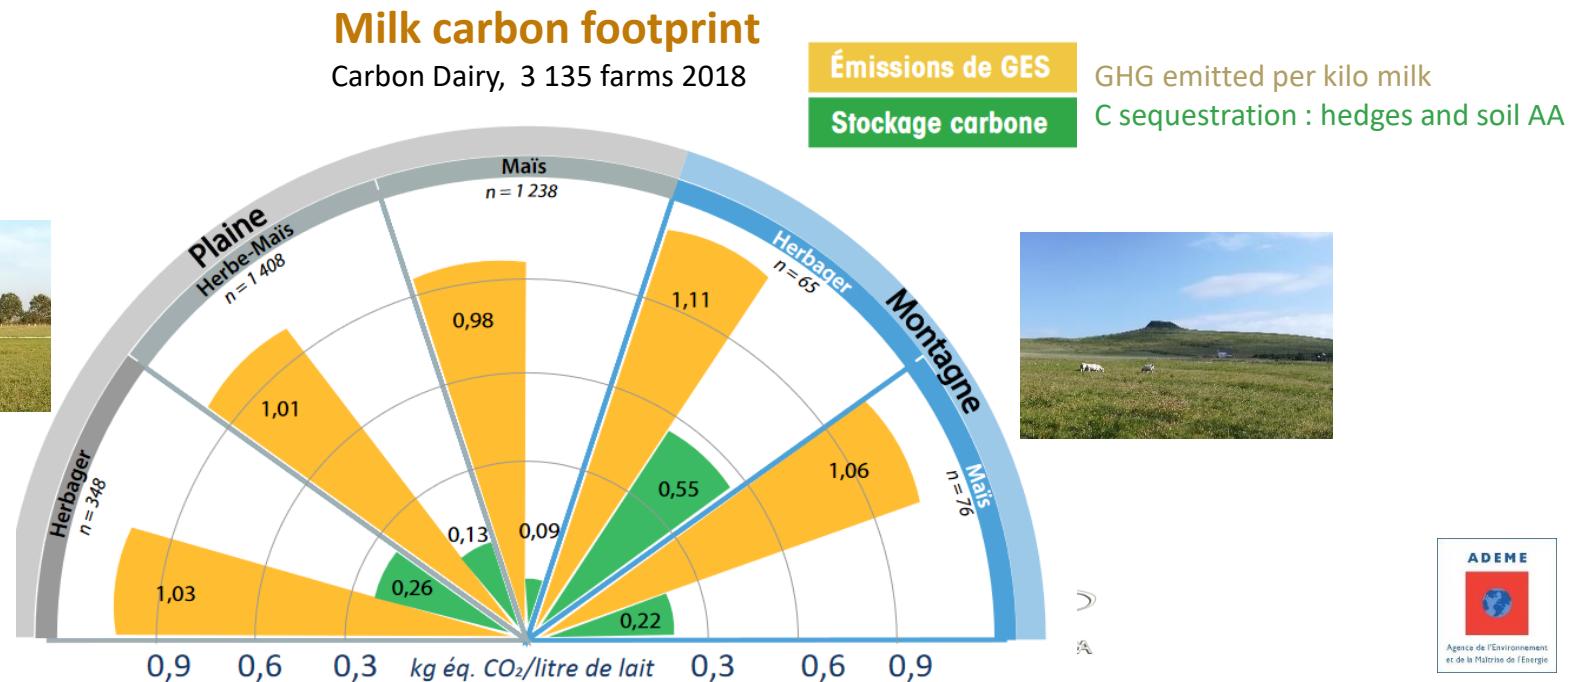

Brittany, ouest of France reduction of grassland area in the last 7 years

CAP2ER : both GHG emissions and C sequestration are considered

To exchange with farmer, GHG emission reduction are considered in regards with C sequestration.

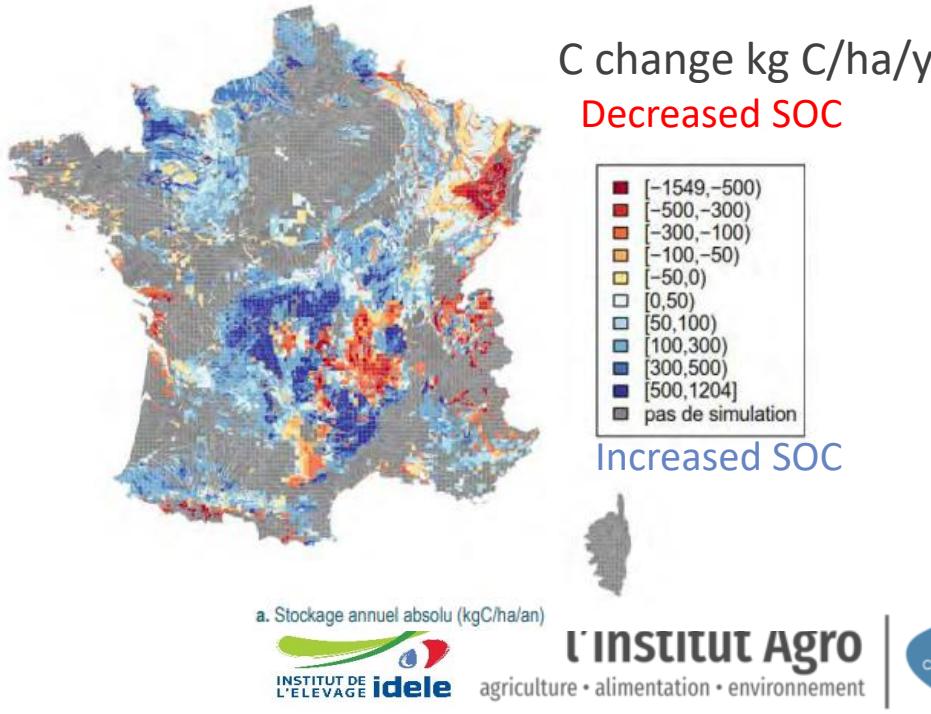

C sequestration is a forfait value linked to cover type (grass/crops)

INRAE 4p1000 study precised the C sequestration potential of French grasslands

Analyses show a large variability of C sequestration potential, depending on land use-management- climate and soil conditions => see INRAE- EsCo Pellerin et al. (2020)

**Evolution of SOC stock under permanent grassland,
when ‘business as usual’, Pellerin et al., dec. 2020**

**On average, permanent grassland sequester +212 kg C/ha/yr , in a 30 years perspective approach
But there are high variations between and within regions**

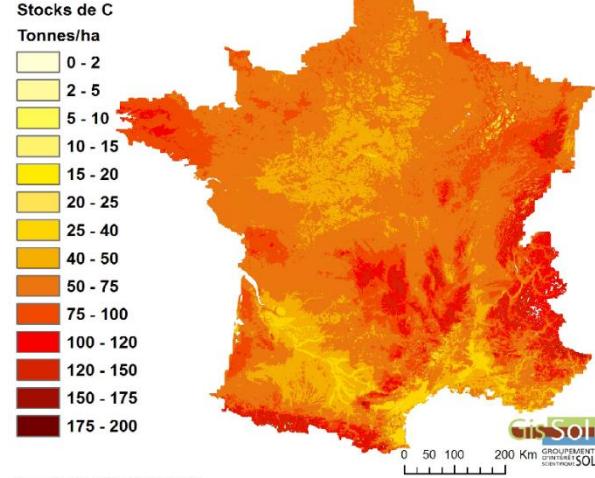

Carsolel project motivation

- Livestock production systems are often located at areas of high soil organic carbon stock.
- To increase SOC at low C areas and prevent from losses at high C areas, tools are needed for advisers and farmers to evaluate effects of agricultural management for livestock production area, including grassland.

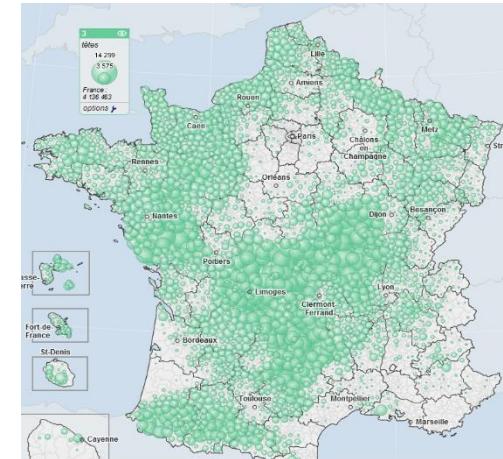

Dairy cattle

Soil organic carbon stock

Beef cattle

Carsolel project partners

- Collaboration between **4 INRAE units and Idele** to create and transfer knowledge on soil C sequestration and modelling (Carsolel project **2018-2021**)
- Carsolel **provides a metamodel to predict C sequestration** on field and farm level :
The development of the Metamodel is based on the 500 000 (1km²) simulations by process-based crop and grassland models over France (*4/1000 study ; Pellerin et al., 2020*)
- This project was funded by ADEME –INTERBEV-CNIEL

Metamodel Carsolel : how does it works?

Metamodele Carsolel estimates average yearly soil organic carbone change in fields

- Over a period of 30 years
- For a given management and soil/climate conditions
- Considering top soil : 0-30 cm

Metamodele Carsolel uses only data available on farm and is fast to run:

- Step 1 : check soil-climatic context
- Step 2 : fill in actual agricultural-management
- Step 3 : discuss with farmer new management, fill in forseen management
- Step 4 : results « Is the project improving SOC and decreasing GHG? »

Step 1 : informations to collect

Sélection de la zone et de l'occupation du sol

You pouvez choisir une zone ou conserver la France métropolitaine entière. Si vous choisissez de sélectionner une zone, les données pédoclimatiques seront présélectionnées en fonction de cette zone.

Selectionner une zone à partir d'une carte

Selectionner une zone en dessinant

Oui

Vous pouvez masquer la carte de sélection une fois votre zone délimitée

- Masquer les cartes (conseillé pour plus de visibilité une fois la sélection faite)
- Affichage de la carte permettant de sélectionner votre zone
- Affichage des UPC sélectionnées (conseillé pour vérifier la zone sélectionnée)

Selectionnez la situation dans laquelle vous êtes : prairies ou grandes cultures

Prairies permanentes

Dans la zone sélectionnées et pour le métamodèle choisi, on a 670 lignes.

Where is the farm located ?

Carsolel considers average rainfall and temperature of climate zone. Value can be adapted by user if needed (e.g. mountain region)

<https://www.geoportail.gouv.fr/donnees/carte-des-sols>

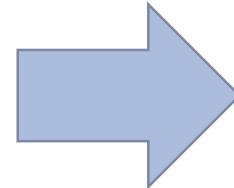

l'institut Agro
agriculture • alimentation • environnement

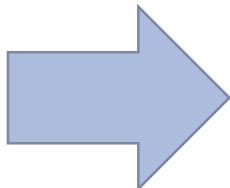

Step 2 : actual situation

Fill in actual management for a group of fields on similar soil type :

Management

- Number of Grazing periods over a year, LSU/Ha
- Number of cut/year, overall yield
- Fertilisation application : organic and mineral.
- N fixation

Grass-Leys

- Years in crops and in temporary grassland
- Mineral and organic fertilisation
- Frequency of cover crop
- Irrigation (yes/no)
- + information on grass management

Step 3: Discuss results with farmer define/simulate new options

If non spreadable area. E.g.

- In Crop rotation : Increase frequency of cover crops, insert a Fodder-crops as lucerne
- In Grass-ley rotation : Increase of life time of sown grasslands in the rotation

Adapt grass management

- Decrease grazing stocking load on very intensive paddocks close to stable
- increase elsewhere by extension of pathways and fence
- Graze mown field if possible

If spreadable area:

Replace mineral fertiliser by manure application

! ?

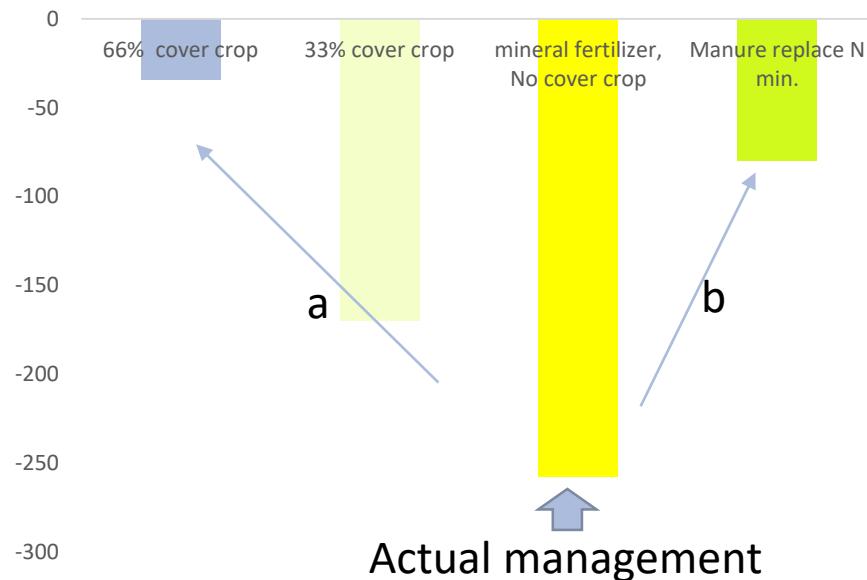

So, many options to combine and test at farm level to increase SOC

Step 4 : Compare options to define best management options at farm level

- Carsolel results for a farm located west of France

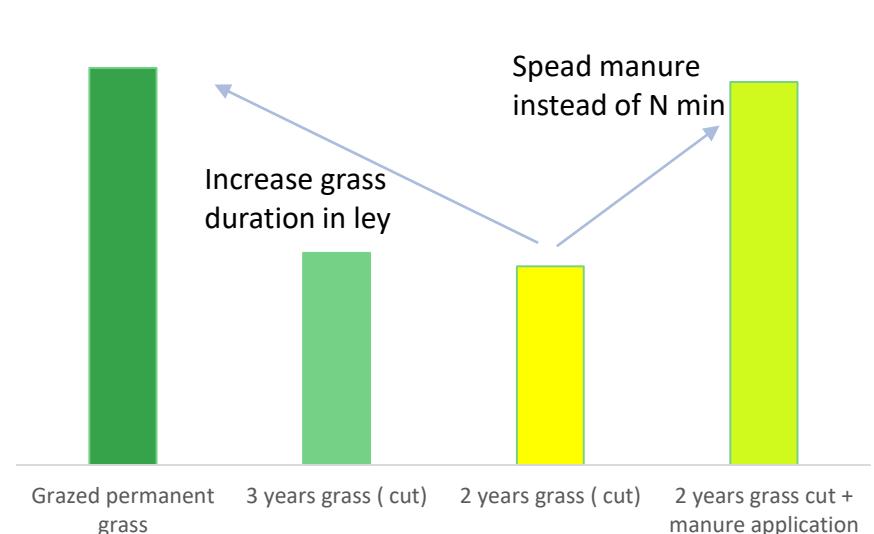

Cropping systems : loss of C

Change in carbone stock 0-30 cm (kg C/ha/year)

Grassland Leys : Gain in C soil

Change in carbon stock 0-30 cm , Kg C/ha/year

Actual management

Actual management

Metamodel Carsolel field test : farmers appreciate

Prototype V0 was tested by French farmers and advisors in Nefertiti Hub, beef carbon and dairy in 2020

=> Refinement in 2021

=> Ready to start in 2022

Nefertiti is an EU networking of demo farmers, ready to test new option

<https://nefertiti-h2020.eu>

Reliability of CarSolEL ?

Carsolel is a statistical approach (randome forest)

based 1km² simulation with Stics (crop) and PaSim (grass) model (Pellerin et al.,2020)

built using 80% of dataset and validate on the 20% remaining

Prediction error on the validation dataset :

Kg C / ha et / an	0-30 cm	Soil profile (Total)
Permanent grassland (PaSim)	48	68
Ley-arable : annual crop and temporary GL (Stics)	41	78
Only cash crops (Stics)	50	60

$$= \sqrt{\frac{(valeur \text{ prédite} \text{ par le métamodèle} - valeur \text{ prédite} \text{ par stics ou pasim})^2}{nb \text{ de données}}}$$

Who can use CarSolEl ?

If you want to be informed when an open acces is launch online,
please send an email to project coordinator helene.chambaut@idele.fr

- the model is built on french pedo-climatic context.
- **It covers most common french soils**, nevertheless it can't be used on some soils : wet soil, organic soils, recently drained soil are excluded for instance
- If your soil-climatic conditions do fit into the validated conditions, simulations can be achieved

- National study on C sequestration potential of French agricultural land

<https://www.inrae.fr/en/news/storing-4-1000-carbon-soils-potential-france>

The INRA study first identified the farming and forestry practices that favour soil C storage and are compatible with agroecology.

Using agronomic and economic modelling, it was possible to simulate the effects of these practices on the evolution of storage over a 30-year period. An original methodology was deployed, using km^2 by km^2 estimates to evaluate the **additional storage** contributed by each new practice compared to changes in C storage if no appropriate measures were implemented.

What is the Life LiveAdapt Project?

LIFE LiveAdapt is part of the LIFE programme of the European Union, in which a multidisciplinary team of entities from Spain, Portugal and France will identify and assess, for four years (2018-2022), solutions for the adaptation to climate change of extensive livestock production models in southern Europe.

FOCUS R&D

ARBELE
L'ARBre dans les exploitations d'ELevelage herbivore

Bien utiliser la litière plaquette dans mon élevage
Comment faire les bons choix ?

OBJECTIFS

- Aider ou renforcer de l'autonomie de l'exploitation en utilisant une ressource en bois disponible sur l'exploitation et dont l'entretien régulier permet de récupérer un produit valorisable et substituable à la paille.
- Proposer un protocole efficace de mise en place de litière plaquette au sein de différents systèmes : aires d'exercices, aires publiques, rotelliers extérieurs et aires extérieures.

La plaquette utilisée en litière : un moyen méconnu de bien valoriser le bois
La ressource bois d'une exploitation permet de produire du bois d'œuvre (forêt), du bois bûche (bâlage et forêt) et du bois de faible valeur (menu bois et bois tendre (vérins, soules, peupliers). En pratiquant une gestion durable de l'ensemble, il est possible de créer de la plus-value notamment sur bois de faible valeur en produisant de la plaquette utilisable en litière.

Fine couche comme antidérapant
(Source : S. Monier, Mission Bois Auvergne Rhône-Alpes)

Recap d'un filtre technique simplifié pour la production de plaquettes

- Coupe des bois du 1^{er} août au 31 mars. Attention lors de la coupe, assurez-vous de la pérennité de la biomasse disponible ; n'hésitez pas à vous faire aider par la Chambre d'Agriculture (il est possible de réaliser une évaluation de la biomasse et se former sur la gestion durable auprès de la Mission Bois Auvergne).
- Déchiquetage (privilégier les déchiqueteuses à couteaux).
- Séchage en tas de 3 m de haut minimum (si possible en intérieur pendant 4 à 6 mois). Le taux d'humidité ne doit pas dépasser 25 % pour que la litière absorbe bien les jus). Attention, si le tas a mal séché, le taux d'humidité des plaquettes peut être de 40-50 %, auquel cas la durée d'absorption de la litière sera divisée par deux.

La mécanisation de ces étapes a fortement évolué. De nouveaux outils permettent de moderniser la récolte des bois. Ils permettent de gagner du temps et de travailler en sécurité. Ils sont à envisager sous forme collective, type CLUMA.

Farmers association in carbon credit label

<https://www.france-carbon-agri.fr/>

The screenshot shows the homepage of the France CARBON AGRI Association. At the top, there is a navigation bar with links for Accueil, L'Association, S'engager, La méthode, Les projets, and Contact. The main header reads "Vous souhaitez vous engager avec France CARBON AGRI Association pour". Below this, there are three circular icons with text: "Réduire vos émissions et stocker du CO2", "Accompagner les agriculteurs dans leurs démarches et valoriser votre travail", and "Soutenir les efforts de réductions et compenser vos émission de CO2". Each icon has a "Plus d'infos" button below it. The bottom section features a diagram titled "FCAA COMMENT ÇA MARCHE ?" showing a flow from "ACHETEUR CARBONE" to "FCAA" to "PORTEUR DE PROJET" to "AGRICULTEURS", with "GES" (Greenhouse Gas) represented by a tree. Logos for IDELE and ADEME are also present.

Thank you for your attention
